

# Post & Rail Installation Instructions

## Step 1

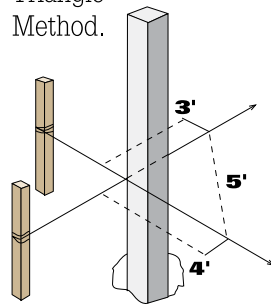

Preparation and layout.

Begin by staking out the fence. Locate the fence corners, gate posts and end posts.

Squaring up the corners

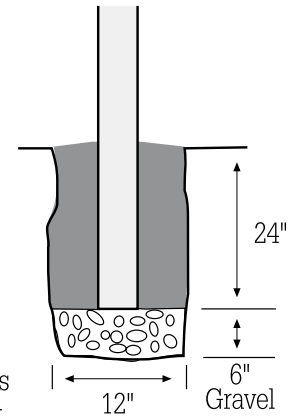

Use the 3-4-5 Triangle Method.

## Step 2

### Setting the posts

Set posts 8' on center. Dig post holes 12" diameter by 30" deep with 6" of gravel. Fill the hole with concrete according to manufacturers instructions leaving a slope for water run off.

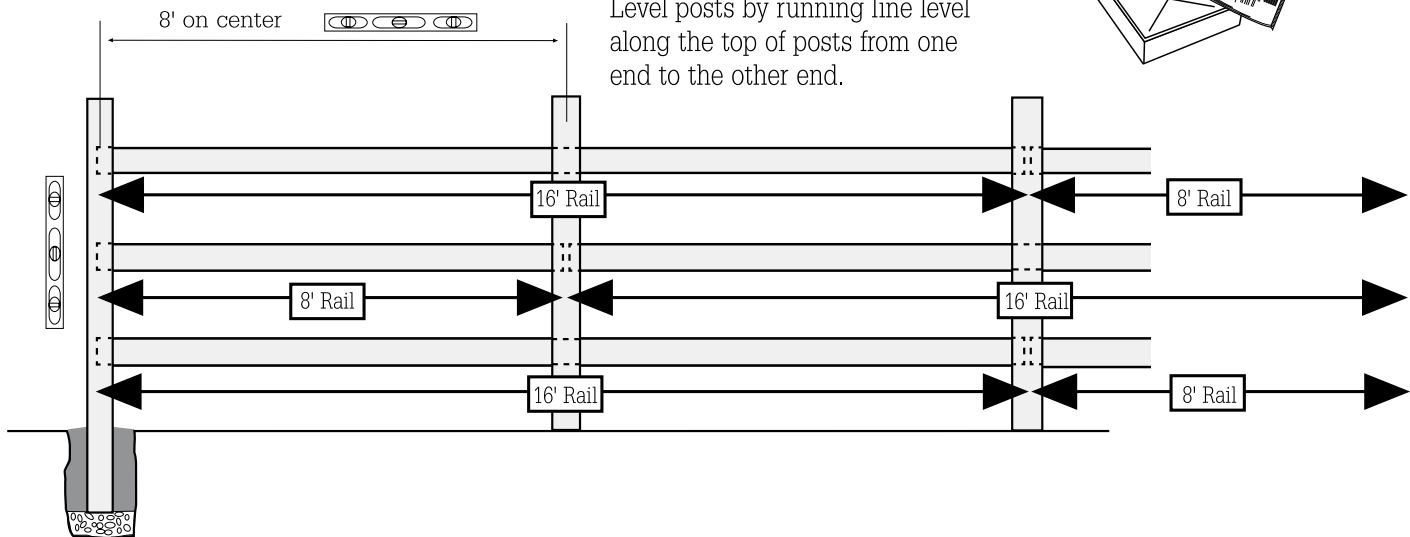

## Step 3 Installing rails

Place rails into notched holes beginning with the lowest rail. Alternate rails so rail ends do not begin at the same post.

### Post Tops

Glue the tops to posts using vinyl adhesive. Place adhesive around inside where the top makes contact to the post. Push down and hold for 10 seconds.

Level posts by running line level along the top of posts from one end to the other end.

## Step 4 Installing Gates

1. Determine left or right hinge mount.
2. Mount hinges opposite side of post from where rivets are located.
3. Center hinges with horizontal top and bottom rails and screw into post.
4. Place gate in position so bottom rail of gate lines up with bottom fence rail.
5. Secure hinges to post and install latch assembly.
